Fault Analysis Report

PAUB-33084 - Netflix some URL detect as HTTP

Fixed the scenario that Netflix connections are not handled by netflix sub protocol instead it was getting handled by http protocol. Netflix signature updated which allows these connections detection as Netflix. New netflix pattern observed in the wild. o...v...e...t...#
The '#' throws off the parser and breaks the detection rules fixed in PAUB-32970.

PAUB-33051 - Policy manager not accepting Valid symbol '[' # | '

Fixed the backend logic of policymanager publish that was failing validation. With regards to the previous fix.

PAUB-28168 fix solved a bug related to the front-end, this bug solves an issue related to the backend. The symptoms are similar but also not the same. This is particularly evident when loading a large number of URIs - the old bug (fixed in 7.0.7) would get you an error immediately before clicking the button to confirm inputs. The bug PAUB-33051 is related to the backend sending a rejection back after the URIs are submitted for storage during the validation stage of publish.

In the first fix, only the local validation was fixed where the contents added to the URI box were getting rejected. The fix did not fix the backend step that occurs after submission, that is what was fixed as a part of this release.
